NRC: 28434

Course: Object Oriented Programing

Consult CSV save information in csv and txt

The Essentials: CSV vs. TXT

CSV (Comma-Separated Values): Tabular format (rows and columns). Each row is a record; columns are separated by commas (,), semicolons (;), or other separators. Ideal for tabular data (spreadsheets, databases).

TXT (Plain Text): Any text without a strict structure. Suitable for notes, human-readable records, logs, etc.

Important Considerations

Encoding: Use UTF-8 (or utf-8-sig to add a BOM so Excel on Windows can better detect UTF-8).

Separator: In countries where decimal points are used (e.g., Spain/Latin America), ; is sometimes preferred as a separator for CSV files when opened with Excel.

Quotation/Escape: If a field contains separators, line breaks, or quotation marks, they must be escaped/enclosed in quotation marks (e.g., "text, with comma"). The libraries handle this for you.

Newlines: Use \n (or adjust \r\n for Windows if necessary).

Headers: Including the row column names makes it easier to read later.

CSV (Comma-Separated Values) Format

- This is a plain text file with data organized into rows and columns.
-
- Each row represents a record, and each column is separated by a comma or semicolon.
-

- It is widely used to import/export data between Excel, databases, or other programs.
